## 2 Assessment Details

### 2.1 Assessment Method

The assessment method is by calculation of the power density  $S$ , electric field strength  $E$ , magnetic field strength  $H$  or magnetic flux density  $B$ .

The calculation uses the spherical model applicable under far field conditions.

$$S = E \times H = \frac{E^2}{\eta} = H^2 \times \eta = \frac{P \times G_i}{4 \times \pi \times r^2}$$

Where:

$\eta$  - Impedance of free space (377 ohm in far field)

$P$  – Transmitter power  $W$

$G_i$  – Antenna gain ratio relative to isotropic

$R$  – Separation distance  $m$

The magnetic flux density is related to the magnetic field strength by a constant:

$$B = \mu_o \times H$$

Where:

$\mu_o$  – Permeability of free space  $4\pi \times 10^{-7} \text{ H/m}$

Where additional calculations are required by the exposure specifications these are detailed below.

The far field region boundary depends on the frequency and wavelength and also on the antenna dimension. The boundary of the far field region is calculated below to demonstrate the validity of using the spherical model.

### 2.2 Approach for Product Installation Compliance Calculation

EU, EN 62232:2017 specifies additional product installation calculation requirements in clause 6.2.4, extract below. This data is used by the network operator or entity putting the Base Station into service. The separation distance calculations  $D_m$  take ground reflection into account and EN 62232:2017 Table 2 Note b specifies a ground reflection factor of 1 (i.e. worst case full in-phase reflection). Additionally, the minimum height  $H_m$  is required to be calculated.

For frequencies between 100 MHz and 400 MHz:

$$H_m = \max \left\{ \begin{array}{l} 2 + \sqrt{\frac{EIRP \cdot A_{sl}}{2\pi}} \\ 2 + \sqrt{\frac{EIRP}{2\pi}} \sin(\alpha + 1.129\theta_{bw}) \end{array} \right. \quad D_m = \sqrt{\frac{EIRP}{2\pi}} \quad (6.1)$$

For frequencies between 400 MHz and 2 000 MHz:

$$H_m = \max \left\{ \begin{array}{l} 2 + \sqrt{\frac{EIRP \cdot 200 A_{sl}}{f\pi}} \\ 2 + \sqrt{\frac{200 \cdot EIRP}{f\pi}} \sin(\alpha + 1.129\theta_{bw}) \end{array} \right. \quad D_m = \sqrt{\frac{EIRP \cdot 200}{f\pi}} \quad (6.2)$$

For frequencies between 2 000 MHz and 100 000 MHz (i.e. 100 GHz):

$$H_m = \max \left\{ \begin{array}{l} 2 + \sqrt{\frac{EIRP \cdot A_{sl}}{10\pi}} \\ 2 + \sqrt{\frac{EIRP}{10\pi}} \sin(\alpha + 1.129\theta_{bw}) \end{array} \right. \quad D_m = \sqrt{\frac{EIRP}{10\pi}} \quad (6.3)$$

where:

- $f$  is the frequency of operation of the RBS in MHz;
- $A_{sl}$  is the side lobe suppression value in linear scale;
- $\alpha$  is the downtilt in radians (both electric and mechanic);
- $\theta_{bw}$  is the vertical half power beamwidth in radians.

## 2.3 Combined Antenna Port RF Exposure Results

The frequencies shown in the tables below have been chosen based on the lowest possible frequency that the EUT can transmit. A full list of the exposure requirements is shown in Annex A.

As the frequency of operation for each transmitter is not the same, in order to evaluate compliance with the limit which is dependent on frequency, the fractional exposure value is calculated: The calculated S power density is divided by the limit to get a fractional exposure value. The calculated E and H fields are divided by the limit and squared to get a fractional exposure value. The summation of the fractional RF exposure results for each transmitter provides the combined result. Any values less than one are compliant with the limit. The compliance boundary distance has been calculated to ensure the summation is  $\leq 1$ .

**Table 19 – Far Field Boundary**

The table below shows the maximum calculated near field / far field region boundaries. The compliance boundary of 4.2 m (minimum) is in the radiating near field region and therefore, the approach described in section 2.1 is an over estimate of the exposure and therefore a conservative assessment.

Field Region	Reactive Near Field Region	Radiating Near Field Region	Far Field Region
Maximum Boundary	< 0.1216 m	0.1216 m – 31.3182 m	> 31.3182 m
Validity of Regions	Spherical model potential under-estimate: SAR assessment required	Spherical model over-estimate and conservative	Spherical model valid
Compliance Boundary Location	N/A	4.2 m	N/A

**Table 20 – Assessment Method Validity**

## 2.7 Uncertainty

The basic computation formulas presented in section 2.1 are conservative formulas for the estimation of RF field strength or power density. No uncertainty estimations are required when using these formulas but there is clear guidance on where and when these formulas are applicable. (Reference EN 62232 clause B.4.1).

For the estimate of S, E or H to be conservative, the transmitter power P and antenna gain  $G_i$  values shall be the upper bounds of uncertainty therefore maximum values are used.

The spherical formula is valid under far field conditions which are established in section 2.6.
