1.1 INTRODUCTION

The information contained in this report is intended to show verification of the Radio Testing of the Nokia Solutions and Networks Oy Multiradio 10 BTS RRH module 2.6GHz Radio Access technology: E-UTRA (TDD) In accordance with FCC 47 CFR Part 2 and FCC 47 CFR Part 27 as part of a class 2 permissive change.

Objective	To perform Radio Testing to determine the Equipment Under Test's (EUT's) compliance with the Test Specification, for the series of tests carried out.
Manufacturer	Nokia Solutions and Networks Oy
Model Number(s)	FZHJ
Serial Number(s)	RY141229174
Number of Samples Tested	1
Test Specification/Issue/Date	FCC 47 CFR Part 2 (2012) FCC 47 CFR Part 27 (2012)
Order Number	451/90546422
Date	26 August 2014
Start of Test	13 April 2015
Finish of Test	28 May 2015
Name of Engineer(s)	Kimmo Huuki Jari Veijola

NOKIA SOLUTIONS AND NETWORKS OY TEST REPORT NO: D532085264

Product Service

TEST REPORT NO: D532085264**FCC ID: VBNFZHJ-01**

Date:	Oulu 02.Jun 2015
Pages:	237
Appendices:	-

Equipment Under Test: Flexi Multiradio 10 BTS RF module 2.6GHz
 Radio Access technology: E-UTRA (TDD)
Type: FZHJ
Manufacturer: Nokia Solutions and Networks Oy
Address: P.O. Box 319,
 Kaapelitie 4, FI-90620, Oulu, Finland

Task: Conformance test according to the specifications
 mentioned below
Test Specification(s): FCC 47 CFR part 2 (2012) and
 FCC 47 CFR part 27 (2012)
Result: The EUT complies with the requirements of the
 specification

The results relate only to the items tested as described in this test report.

1. SUMMARY

Due to new Software features new carrier configurations are available to FZHJ unit and FCC class 2 permissive change is mandatory to grant the permission to use these configurations.

The following tests were performed according to the FCC rules in order to verify the compliance of the EUT with the FCC requirements:

Test No.	Measurement	FCC Rule	Page Number of this Report	Result
1	RF Power Output	§ 2.1046, § 27.50	8	compliant
2	Modulation Characteristics	§ 2.1047, § 2.201	17	compliant
3	Occupied Bandwidth	§ 2.1049	18	compliant
4	Spurious Emissions at Antenna Terminals	§ 2.1051, § 2.1057, § 27.53	23	compliant
5	Field Strength of Spurious Radiation	§ 2.1053, § 2.1057, § 27.53, § 27.55	48	compliant

Table 1 Results – Summary

In accordance with the FCC Rule §15.3 (z) the equipment was tested with the limits that are valid for an *unintentional radiator*.

Measurements guidance: FCC OET laboratory KDB: 662911 D01 Multiple Transmitter Output v01r02 and FCC OET KDB:971168 D01 Power Meas License Digital Systems v02r01.

2. EQUIPMENT UNDER TEST

The EUT is a LTE Base transceiver station RF module 2.6GHz with 8 power amplifiers.

The BTS performs the full RAN function of LTE system (evolved UTRA). This is sometimes referred to as collapsed RAN, where equivalent functions of former 3G BTS and 3G RNC are all integrated into BTS. BTS is connected directly to the core network via S1 interface, and to mobile stations via Air interface (Uu). In addition BTSSs are optionally connected directly to each others via X2 interface for handover purposes. The tested equipment is representative for serial production.

2.1 Configuration of EUT

The used different EUT configurations are shown by the following table.

Module Type	Flexi Multiradio BTS RF module 2.6GHz	
Radio Access Technology	E-UTRA	
Duplex mode	Time Division Duplex (TDD)	
Channel Bandwidth	Single carrier 10MHz (Config. A), Single carrier 15MHz (Config. B), Triple carrier 20MHz (Config C).	
Supply Voltage	48.0 V DC	
Frequency Bands		
Channel Bandwidth 10MHz	Lowest tunable freq. Single carrier	2501.0 MHz
	Middle freq. Single carrier	2593.0 MHz
	Highest tunable freq. Single carrier	2685.0MHz
Channel Bandwidth 15MHz	Lowest tunable freq. Single carrier	2503.5 MHz
	Middle freq. Single carrier	2593.0 MHz
	Highest tunable freq. Single carrier	2682.5 MHz
Channel Bandwidth 20MHz	Lowest tunable freq. Triple carriers	2506.0/2526.0/2546.0 MHz
	Middle freq. Triple carriers	2573.0/2593.0/2613.0 MHz
	Highest tunable freq. Triple carriers	2640.0/2660.0/2680.0 MHz
Single carrier		
Rated Output Power (Prat)	10W(40dBm),10MHz /15W (43.0dBm),15MHz conducted / carrier	
Triple carrier		
Rated Output Power (Prat)	6.6W (38.2dBm), 20MHz conducted / carrier	
Downlink/Uplink ratio	6/3 to 8/1	
	RX	TX
Number of Antenna Ports	8 (ANT1 to ANT8)	8 (ANT1 to ANT8)
MiMo	Yes	Yes

Table 2 Overview of EUT configuration

The tests were performed with one EUT at the antenna ports ANT1, ANT2, ANT3, ANT4, ANT5, ANT6, ANT7 or ANT8.

The used different EUT configurations are shown by the following table.

Product Service

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

Module Name	Serial-No.	Module Type	Config.
FZHJ	RY141229174	Radio module	A, B, C
Other Modules	Module Type		Config.
FSIH	System module		A, B, C
FFHS	Rejection filter		A, B, C

Table 3 Configuration of EUT

For a functional description of the modules, please refer to the appropriate related parts and exhibit sections of this certification application.

2.2 Operating Conditions

The EUT supports QPSK, 16QAM and 64QAM modulation. If not stated otherwise, the following standard setup procedure for the EUT was used:

The transmitter was set up according to 3GPP TS 36.141 E-UTRA Test Models (E-TM) for all tests:

- E-TM 1.1: All QPSK modulation testing
- E-TM 3.1: All 64QAM modulation testing
- E-TM 3.2: All 16QAM modulation testing

During the measurements, one carrier channel was tested at a time. The carrier was set to the maximum power level to ensure the maximum emission amplitudes during all measurements.

During the tests, the Flexi Multiradio BTS is transmitting a pseudo random bit pattern on the data channels. This ensures that the measurements of the emission characteristics of the transmitter are pursuant to § 2.1049.

Test models E-TM1.1, E-TM3.1 and E-TM3.2 have uplink/downlink ratio 3:6.

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

3. TEST CONFIGURATION

If not stated otherwise, the following measurement configuration was used to perform all measurements (see figure below).

Figure 1 Test Configuration (single output)

The RF output of the transceiver (cell) under test is connected to a signal analyzer via a high power attenuator to protect the input of the signal analyzer from high RF power levels. A description of the analyzer settings is given in each of the sections describing the measurements. The other transceivers are terminated.

A complete list of the measurement equipment is included on page 50 of this measurement report.

3.1 Calibration of the Test Equipment

All relevant test equipment has a valid calibration from an external calibration laboratory. Additionally the signal analyzer has a built-in self-calibration procedure. This calibration procedure was activated prior to the measurements so that the analyzer is deemed accurate. High quality cables were used to connect the measurement equipment to the EUT. The actual loss of the attenuator and the cables was measured with a high precision network analyzer and taken into account for all measurements.

FCC ID:
VBNFZHQ-01

Test Report No:
D532085264

4. TEST RESULTS

4.1 Test No. 1: RF Power Output (§ 2.1046, § 27.50)

4.1.1. Limits

Para. No. 27.50 (h).(1) Main, booster and base stations. (i) The maximum EIRP of a main, booster or base station shall not exceed $33 \text{ dBW} + 10\log(X/Y) \text{ dBW}$, where X is the actual channel width in MHz and Y is either 6 MHz if prior to transition or the station is in the MBS following transition or 5.5 MHz if the station is in the LBS and UBS following transition, except as provided in paragraph (h)(1)(ii) of this section.

Sample calculation: $33 \text{ dBW} + 10\log(10\text{MHz}/5.5\text{MHz}) \text{ dBW} = 34.26 \text{ dBW} = \sim 2667 \text{ W}$

4.1.2. Test Procedure and Results

Detachable Antenna: The maximum output power at the antenna terminals was measured using a signal analyzer.

The RF power was measured with a frequency sweep across the carrier (see screenshots). The carrier power was calculated from the signal analyzer by integration over the result. The base station maximum output power is the sum of the measured carrier power and the external attenuation (cable loss of the test set up).

For the MiMo output, RF power output was measured from each antenna port individually and the results summed mathematically in accordance to FCC KDB 662911 D01 -guidance.

Peak to average power (PAPR) was examined using CCDF method and 0.1% value recorded in dB to the tables below.

External filter and Cables insertion losses were measured with ZVA network analyzer. These losses should be added to measured output power results to get correct values in output power test, because measurement point is now in filter antenna port not as normally in RF modules antenna port.

Measured insertion losses are below.

Channel Frequency:	Carrier RBW:	Cable+Filter path loss:
2501/2593/2685 MHz	10MHz	-0.70/-0.88/-0.95 dB
2503.5/2593/2682.5 MHz	15MHz	-0.73/-0.88/-0.86 dB
2506/2526/2546 MHz	20MHz	-0.74/-0.70/-0.52 dB
2573/2593/2613 MHz	20MHz	-0.72/-0.70/-0.57 dB
2640/2660/2680 MHz	20MHz	-0.85/-0.48/-0.80 dB

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

The following table shows the measured output powers at the antenna connector.

Table 6 RF Power Output (20 MHz Channel BW)

The base station maximum output power was found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

Product Service

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

4.2 Test No. 2: Modulation Characteristics (§ 2.1047, § 2.201)

The occupied bandwidth was measured by using relative measurement procedure (Config. A, C and E), which represents the -26dB OBW positive frequency between two markers to reference value (see the following section and screenshots on pages 56).

Therefore, the modulation characteristic of the base stations transceiver is:

Config A: 9M00D9W (Channel bandwidth 10 MHz)

Config C: 13M5D9W (Channel bandwidth 15 MHz)

Config E: 18M0D9W (Channel bandwidth 20 MHz)

No further testing is required under this section of the FCC rules. No measurements other than the occupied bandwidth are required.

Sample modulation screenshots are on page 52, in I/Q constallation diagrams and tables, showing QPSK, 16QAM and 64QAM –modulation generation.

The modulation characteristics were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

4.3 Test No. 3: Occupied Bandwidth (§ 2.1049)

4.3.1. Limits

Para. No. 2.1049. The 99% occupied bandwidth is the width of a frequency band such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to 0.5% of the emitted power.

According FCC KDB 971168 D01 –guidance. Relative OBW must be measured and reported when it is specified in the applicable rule part in this case §27.53 (5).

4.3.2. Test Procedure and Results

Measurement procedure. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

(Screenshots are on page 56 for details). The following tables summarize the results:

Config A:

Carrier Frequency [MHz]	Occupied Bandwidth [MHz]	Result
QPSK-Modulation ANT1		
2501.0	9.52	compliant
2593.0	9.48	compliant
2685.0	9.46	compliant

Table 8 Occupied Bandwidth (15 MHz Channel BW)

The occupied bandwidth was found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

4.4 Test No. 4: Spurious Emissions at Antenna Terminals (§ 2.1051, § 2.1057, § 27.53)

4.4.1. Limits

Para. No. 27.53(l). For BRS and EBS stations, the power of any emissions outside the licensee's frequency bands of operation shall be attenuated below the transmitter power (P) measured in watts.

(l)(2) For fixed and temporary fixed digital stations, the attenuation shall be not less than $43 + 10 \log_{10} P$ dB (P = transmitter power in Watts).

The compliance limit was calculated in the following way:

Maximum transmitter output power [W]: P

Maximum transmitter output power [dBm]: $30 + 10 \log_{10} P$ (conversion from W to dBm)

Attenuation required by FCC: $43 + 10 \log_{10} P$

$$\begin{aligned} \text{Compliance limit} &= \text{Maximum transmitter output power} - \text{Required attenuation} \\ &= 30 + 10 \log_{10} P - (43 + 10 \log_{10} P) = \underline{-13 \text{ dBm}} \end{aligned}$$

For MiMo output from 8 TX -antenna connectors, each antenna connectors were measured individually and each individual limit lime was reduced by $10\log(8)$. Limit line was calculated to show -22.03dB emission limit, according to FCC KDB 662911 D01 guidance.

4.4.2. Test Procedure and Results

The tests were carried out in accordance with § 27.53. For all frequency ranges except two (immediately below and above the carrier frequency block) a 1 MHz resolution bandwidth was used for the measurements.

In the 1 MHz frequency bands immediately outside and adjacent to the carrier frequency block the resolution bandwidth is lowered to 1% of the 26 dB occupied bandwidth of the transmitted carrier.

According to § 2.1057, all emissions including the fundamental frequency from the lowest radio frequency generated in the equipment, without going below 9 kHz, up to the 10th harmonic were investigated.

The following tables summarize the worst case detected emission levels (see screenshots on page 80 for details). The external attenuation (cable loss of the set up) is already added in the results. It can be seen separately as the 'Offset' value in the screenshots.

Table 23 Spurious Emissions (20 MHz Channel BW)

The measured conducted emission levels were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

4.5 Test No. 5: Field Strength of Spurious Radiation (§ 2.1053, § 2.1057, § 27.53)

4.5.1. Limits

Para. No. 27.53(m). For BRS and EBS stations, the power of any emissions outside the licensee's frequency bands of operation shall be attenuated below the transmitter power (P) measured in watts.

(m)(2) For digital base stations, the attenuation shall be not less than $43 + 10 \log (P)$ dB (P = transmitter power in Watts).

4.5.2. Test Configuration

The measurements were performed in an anechoic chamber. The radiated test site complies with the site attenuation requirements listed in ANSI C63.4 2003 and is listed with the FCC.

Figure 2 Test Configuration

Photographs of the EUT in the anechoic chamber are shown on page 224 of this measurement report.

4.5.3. Test Procedure and Results

TIA/EIA-603-C-2004, Section 2.2.12

The test was performed in a semi-anechoic shielded room. The EUT was placed on a non-conductive 0.8 m high table standing on the turntable. During the test in the frequency range 30 - 26500 MHz the distance from the EUT to the measuring antenna was 3 m. In order to find the maximum levels of the disturbance radiation the angle of the turntable, the height of the measuring antenna were varied during the tests. The test was performed with the measuring antenna being both in horizontal and vertical polarizations.

FCC ID:
VBNFZHJ-01

Test Report No:
D532085264

Vertical and horizontal polarizations in the frequency range 30 - 26500 MHz was first measured by using the peak detector. During the peak detector scan the turntable was rotated from 0° to 360° with 30° step with the antenna heights 1.0 m and 2.5 m.

The limit of -13 dBm has been calculated to correspond 84.4 dB (μ V/m). Spurious emissions closer than 20 dB to the limit was measured with average detector.

According to § 2.1057, all emissions from the lowest radio frequency generated in the equipment, without going below 9 kHz, up to the 10th harmonic were investigated.

The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The EUT was replaced with a reference substitution antenna with a known gain referenced to an isotropic radiator $G_{Antenna[dBi]}$. This antenna was fed with a signal at the spurious frequency $P_{Gen[dBm]}$. The level of the signal was adjusted to repeat the previously measured level. The resulting

EIRP is the signal level fed to the reference antenna corrected for gain referenced to an isotropic.

The formula below was used to calculate the EIRP of the EUT.

$$P_{EIRP[dBm]} = P_{Gen[dBm]} - L_{Cable[dB]} + G_{Antenna[dBi]}$$

Worst case detected emission levels are reported in the following table (refer to spectral plots included on pages 100 for details). The antenna factor and cable loss is according to the manufacturer's specification.

Config A, B, C:

Carrier Frequency:Error! Reference source not found.			
Frequency Range [MHz]	Emission Frequency [MHz]	Maximum Emission Level [dBm]	Result
QPSK-Modulation TX1			
30 - 26500	26401	-19.36 dBm	compliant
Measurement Uncertainty:			±5.4dB

Table 6 Field Strength of Spurious Radiation (10, 15 and 20 MHz Channel BW)

The measured emission levels were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.
