Transmitter Radiated Spurious Emissions

During radiated emission testing all antenna ports of the base station were terminated with 50ohm termination blocks as shown in the diagram below.

See ANSI C63.26-2015 paragraph 5.1 for details of test setup requirements. Based on antenna port conducted spurious emissions tests results, preliminary scans for radiated spurious emissions were performed in 30MHz – 22GHz frequency range. One radiated emission test configuration was used to prove compliance for both the AWS and PCS frequency bands. The 3GPP Band 25 and the 3GPP Band 66 transmitters were enabled simultaneously at maximum power using QPSK modulation on all four ports for this test. The test includes channel bandwidth with the highest spectral density (LTE1.4) for both frequency bands . The bottom, middle and top frequency channels for each band were enabled. The carrier configuration for the radiated emission testing is provided below. Final maximized peak radiated emissions were measured in these modes.

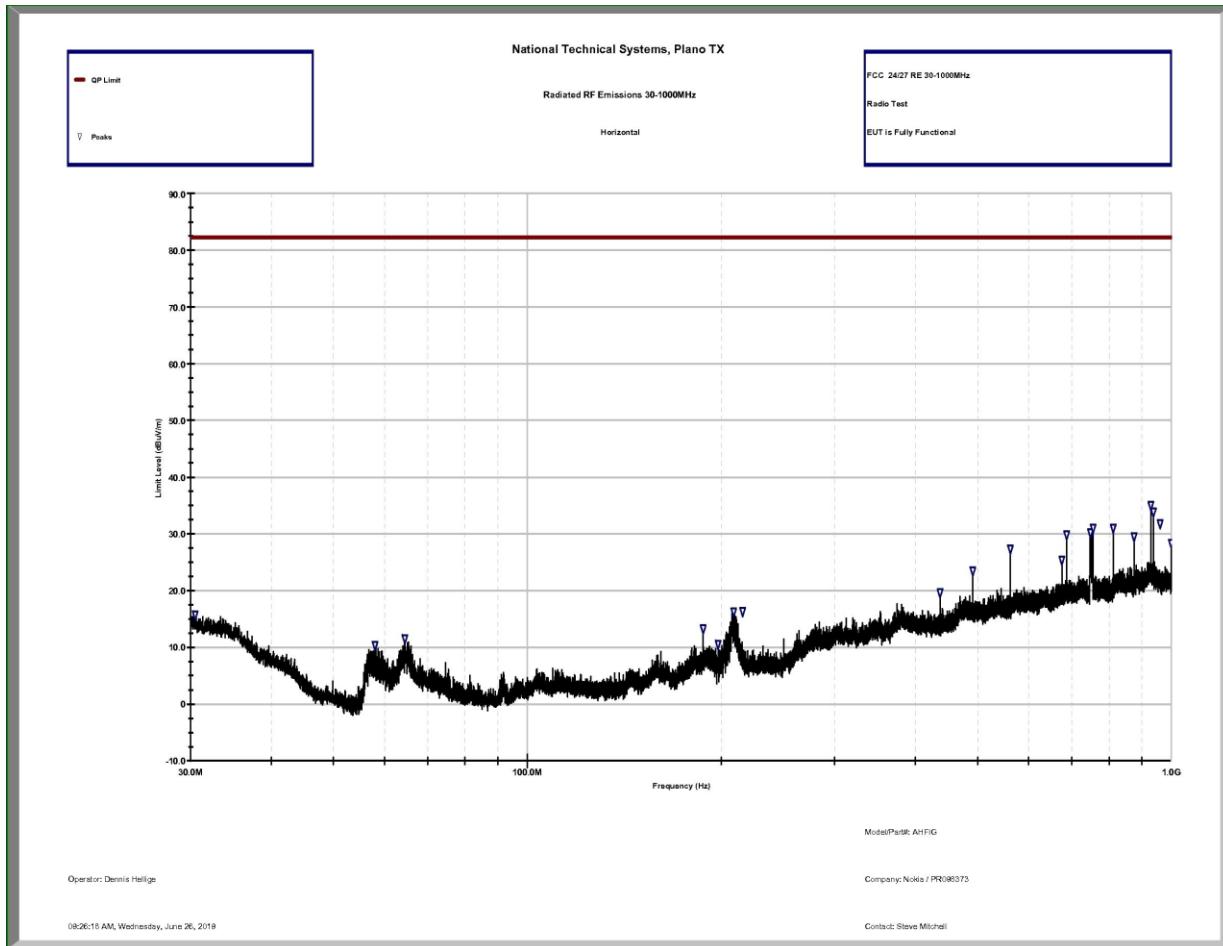

Frequency Band	Antenna Port	RF Bandwidth	EARFCN	Transmit Frequency
PCS	1	1.4 MHz	8047 (Bottom Channel)	1930.7 MHz
PCS	2	1.4 MHz	8365 (Middle Channel)	1962.5 MHz
PCS	3	1.4 MHz	8633 (Top Channel)	1989.3 MHz

AWS	3	1.4 MHz	66886 (Middle Channel)	2155.0 MHz
AWS	4	1.4 MHz	67329 (Top Channel)	2199.3 MHz

RE Data

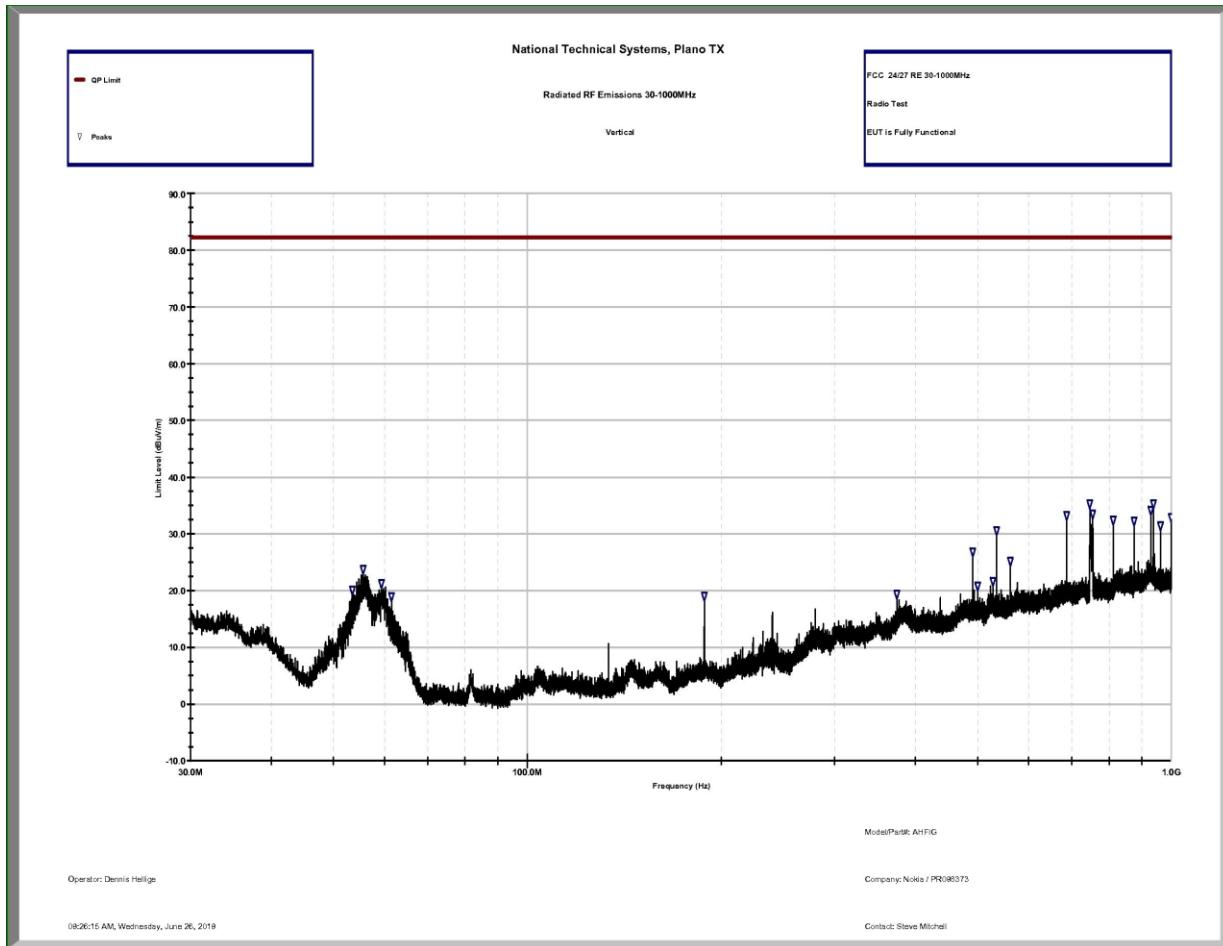

A three-meter measurement distance was used for radiated emission less than 10GHz. A one-meter measurement distance was used for radiated emission greater than 10GHz. The highest radiated emissions detected were more than 20dB below the three-meter limit of 82.2dB_uV/m and the one-meter limit of 91.7dB_uV/m (equivalent to -13dBm EIRP). Since all maximized measurements were more than 20dB below these levels, substitution measurements were not performed. TILE software was used for all preliminary scans and plots that are included on the following pages.

Frequency Stability/Accuracy

Carrier frequency stability at extreme temperatures and voltages, frequency error was measured as follows:

- (1) Transmitting in 5MHz-QPSK-LTE mode at PCS center channel (1962.5MHz) and AWS center channel (2155MHz) on port 3.
- (2) Transmitting in QPSK-WCDMA mode at PCS channel 9750 (1950.0MHz) and AWS center channel (2140MHz) on port 2.
- (3) Transmitting in GMSK - GSM mode at PCS channel 711 (1970.0MHz) on port 1.
- (4) The EUT temperature was stabilized at each temperature step (for a minimum of 30 minutes) prior to frequency accuracy measurement.

Nominal operating voltage of the product is declared as 48VDC. Frequency error results are listed below for extreme voltages and temperatures.

Test Summary:

Worst Case Frequency Error					
Measurement Parameter	PCS 1962.5MHz LTE5	AWS 2155.0MHz LTE5	PCS 1950.0MHz WCDMA	AWS 2140.0MHz WCDMA	PCS 1970.0MHz GMSK
Hertz	1.72 Hz	1.81 Hz	4.36 Hz	4.50 Hz	3.96 Hz
Parts Per Million	0.0009 PPM	0.0008 PPM	0.0022 PPM	0.0021 PPM	0.0020 PPM

The highest frequency error for each test case (radio technology-frequency band) is highlighted. Based on the results above, the highest recorded frequency error (4.36 Hz or 0.002 PPM) ensures that the transmitted signal remains in its authorized frequency block at extreme voltages and temperatures. The results above are deemed sufficient to demonstrate carrier frequency stability for all other channel bandwidth modes and modulations since all carriers are controlled by the same frequency stabilization circuitry that was subjected to the extreme conditions under this test.

APPENDIX B: ANTENNA PORT LTE TEST DATA FOR THE AWS BAND

All conducted RF measurements in this section were made at AHFIG antenna ports. All available LTE channel bandwidths (1.4, 3, 5, 10, 15 & 20MHz) with all available modulation types (QPSK, 16QAM, 64QAM & 256QAM) were measured. The LTE modulation types are setup according to 3GPP TS 36.141 E-UTRA Test Models (E-TM) as follows E-TM 1.1: QPSK, E-TM 3.1: 64QAM, E-TM3.1a: 256QAM and E-TM 3.2: 16QAM. The test setup used is provided below.

Test Setup Used for AHFIG Conducted RF Measurements

RF Output Power

RF output power has been measured in RMS Average terms for each AWS transmit chain at the middle channel (2155.0MHz) for 256QAM modulation and LTE5 bandwidth as described in section 5.2 of KDB 971168 D01v03r01 and ANSI C63.26-2015 section 5.2.4.4. The RRH was operated at maximum RF output power. The peak to average power ratio (PAPR) has been measured using the signal analyzer complementary cumulative distribution function (CCDF) for a probability of 0.1% as described in section 5.7.2 of KDB971168 D01v03r01 and ANSI C63.26-2015 section 5.2.3.4. All results are presented in tabular form below. The highest measured values are highlighted.

Antenna	LTE Bandwidth	LTE - 256QAM	
		PAPR (dB)	Average (dBm)
Port 1 Middle Channel	5M	7.26	45.90
Port 2 Middle Channel	5M	7.26	45.87
Port 3 Middle Channel	5M	7.24	45.98
Port 4 Middle Channel	5M	7.23	45.96

The variation in RMS output power levels between the antenna ports is 0.11 dB per data sample provided above. Pre-compliance testing (and testing of similar EUTs) shows that the output power variation between antenna ports is small (the output ports are essentially electrically identical). The highest power port was selected as the worst case.

Pre-compliance testing has shown that the output power variation between modulation types is small. Antenna port 3 power output measurements for the LTE5 bandwidth for all modulation types on the middle (center) channel are provided below.

	Modulation Type							
	QPSK		16QAM		64QAM		256QAM	
	PAPR (dB)	Ave (dBm)	PAPR (dB)	Ave (dBm)	PAPR (dB)	Ave (dBm)	PAPR (dB)	Ave (dBm)
Antenna Port 3 Middle Channel LTE5	7.25	46.01	7.25	46.03	7.21	46.06	7.24	45.98

The output power variation between modulation types is small in this measurement snapshot (and from past efforts on similar hardware as well). The variation of average power output versus modulation type is 0.08dB for the data snapshot provided. The variation of PAPR versus modulation type is 0.04dB for the data snapshot provided. All power measurements in this report (except the sample test noted above) were performed with the EUT operating with 256QAM modulation.

Based on the results above, Port 3 had the highest LTE RMS average power for the AWS band (represents the worst case) and therefore it was selected for all the remaining antenna port tests. Port 3 has the highest combined LTE RMS average power for the AWS + PCS bands. Subsequently output power levels on bottom, middle, and top channels in all 6 LTE channel bandwidths and 256QAM modulation type were tested only at Port 3 and the results presented below. The highest measured values are highlighted.

Antenna LTE Channel	LTE Bandwidth	LTE - 256QAM	
		PAPR (dB)	Average (dBm)
Port 3 Bottom Channel	1.4M	7.28	45.88
	3M	7.24	45.91
	5M	7.26	45.90
	10M	7.25	46.13
	15M	7.25	46.17
	20M	7.24	46.15
Port 3 Middle Channel	1.4M	7.22	45.82
	3M	7.25	45.89
	5M	7.25	46.03
	10M	7.24	45.96
	15M	7.21	45.93
	20M	7.19	45.86
Port 3 Top Channel	1.4M	7.26	45.88
	3M	7.23	45.85
	5M	7.26	46.06
	10M	7.27	46.02
	15M	7.26	46.08
	20M	7.25	46.15

The data provided in the table shows (and testing of similar EUTs) that the output RMS power variation between channel bandwidths at the center frequency channel is small (0.21dB).

RF output power has been measured in RMS Average terms for each AWS multicarrier test configuration to verify/document the power levels. All results are presented in tabular form below.

Measured RMS Average Carrier Power Level for the Multicarrier Configurations at Antenna Port 3			
AWS Multicarrier LTE1.4		Multiband Multicarrier LTE1.4

43.80 dBm (24.0 Watts)	41.10 dBm (12.9 Watts)		
Total Carrier Power in AWS Band is 36.9 Watts or 45.7 dBm		See Appendix A for data and test results for this test case	

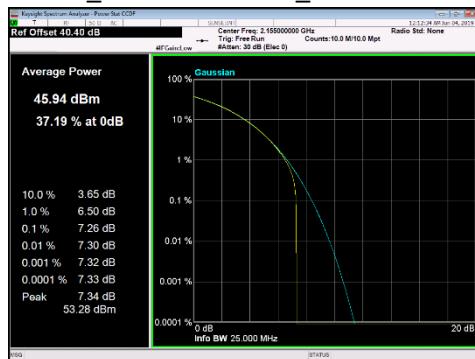

All measurement results are provided in the following pages. The total measurement RF path loss of the test setup (attenuator and test cables) was 40.4 dB and is accounted for by the spectrum analyzer reference level offset.

Emission Bandwidth (26 dB down and 99%)

Emission bandwidth measurements were made at antenna port 3 on the middle channel with maximum RF output power. All available LTE modulations (QPSK, 16QAM, 64QAM and 256QAM) were used. All available LTE channel bandwidths (1.4 MHz, 3MHz, 5MHz, 10MHz, 15MHz, and 20MHz) were used.

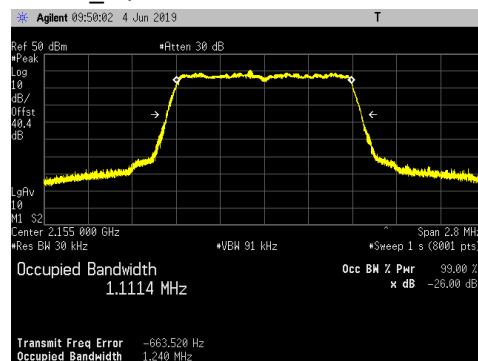

The 26dB emission bandwidth was measured in accordance with section 4 of FCC KDB 971168 D01v03r01 and ANSI C63.26 section 5.4. The 99% occupied bandwidth was measured in accordance with section 6.7 of RSS-Gen Issue 5. For both measurements, an occupied bandwidth built-in function in the spectrum analyzer was used. The results are provided in the following table. The largest emission bandwidths in each channel type are highlighted.

LTE Channel Bandwidth	Modulation Type

Antenna Port Conducted Band Edge

Conducted band edge measurements were made at RRH antenna port 3.

Single Carrier Test Cases

The RRH was operated at the band edge frequencies with all modulation types (QPSK, 16QAM, 64QAM and 256QAM) for all LTE bandwidths (1.4MHz, 3MHz, 5MHz, 10MHz, 15MHz and 20MHz) at maximum power (40 watts/port and 40 watts/carrier).

AWS Multicarrier Multiband Test Case

In the AWS band: Three LTE1.4 carriers (based upon KDB 971168 D03v01) using two carriers (with minimum spacing between carrier frequencies) at the lower band edge (EARFCN 66443: 2110.7 & EARFCN 66457: 2112.1MHz) and a third carrier with maximum spacing between the other two carrier frequencies (EARFCN 67329: 2199.3MHz) at the upper band edge. In the PCS band: Single LTE1.4 carrier at the middle channel (EARFCN 8365: 1962.5MHz). The smallest channel bandwidth was selected to maximize carrier power spectral density. The carriers were operated at maximum power (~13W/AWS carrier and 80W/PCS carrier) with a total port power of 120 watts (80W for PCS band carrier + 40W for AWS band carriers). The same modulation type was used for both PCS and AWS carriers.

Multicarrier Multiband Test Case

Three LTE1.4 carriers (based upon KDB 971168 D03v01) using two carriers (with minimum spacing between carrier frequencies) at the PCS band lower band edge (EARFCN 8047: 1930.7 & EARFCN 8061: 1932.1MHz) and a third carrier with maximum spacing between the other two carrier frequencies (EARFCN 67329: 2199.3MHz) at the AWS band upper band edge. The smallest channel bandwidth was selected to maximize carrier power spectral density. The carriers were operated at maximum power (40W/PCS carrier and 40W/AWS carrier) with a total port power of 120 watts (80W for PCS band carriers + 40W for AWS band carrier). The same modulation type was used for both PCS and AWS carriers. Data for this test case is in Appendix A.

The limit of -19dBm was used in the certification testing. The limit is adjusted to -19dBm [-13dBm -10 log (4)] per FCC KDB 662911D01 v02r01 because the BTS may operate as a 4 port MIMO transmitter.

Measurements were performed with the spectrum analyzer in the RMS average mode over 100 traces. In the 1MHz bands outside and adjacent to the frequency block, a resolution bandwidth of 1% of the emission bandwidth was used. In the 1 to 2MHz frequency range outside the band edge (i.e.: 2108 to 2109MHz and 2201 to 2202MHz bands) the RBW was again reduced to 1% of the emission bandwidth and the power integrated over 1MHz. In the 2 to 22MHz frequency range outside the band edge (i.e.: 2088 to 2108MHz and 2202 to 2222MHz bands) a 1MHz RBW and 3MHz VBW was used.

The results are summarized in the following table. The highest (worst case) emissions from the measurement data are provided.

The total measurement RF path loss of the test setup (attenuator and test cables) was 40.4 dB and is accounted for by the spectrum analyzer reference level offset. The display line on the plots reflects the required limit.
