Test Report No.: C12N0014

**FCC ID: VBNFRIE-01** 

**Order No.:** C12N **Pages:** 104 **Munich,** Dec 18, 2009

Client: Nokia Siemens Networks Oy

Equipment Under Test: Flexi LTE RF Module 1.7/2.1GHz

Manufacturer: Nokia Siemens Networks Oy

Task: Conformance test according to the test specifications mentioned

below

Test Specification(s): FCC 47 CFR Part 2 and 27

Result: The EUT complies with the requirements of the specification.

Mul Josef Buer

The results relate only to the items tested as described in this test report.

# 1 Summary

The measurements described in this report were conducted pursuant to 47 CFR § 2.947 and § 2.1041. All applicable paragraphs of the 47 CFR parts 2 and 27 of the most current version of the rules were considered.

The following tests were performed according to the FCC rules in order to verify the compliance of the EUT with the FCC requirements:

| Test No. | Measurement                             | FCC Rule                       | Page Number of this Report | Result    |
|----------|---|--------------------------------|----------------------------|-----------|
| 1        | RF Power Output                         | § 2.1046, § 27.50              | 11                         | compliant |
| 2        | Modulation<br>Characteristics           | § 2.1047, § 2.201              | 15                         | compliant |
| 3        | Occupied Bandwidth                      | § 2.1049                       | 16                         | compliant |
| 4        | Spurious Emissions at Antenna Terminals | § 2.1051, § 2.1057,<br>§ 27.53 | 19                         | compliant |
| 5        | Field Strength of Spurious Radiation    | § 2.1053, § 27.53              | 23                         | compliant |
| 6        | Frequency Stability                     | § 2.1055, § 27.54              | 25                         | compliant |

**Table 1-1: Results – Summary** 

In accordance with the FCC Rule §15.3 (z) the equipment was tested with the limits that are valid for an *unintentional radiator*.

| Stefan Obermaier (SGS CQE) | Editor                |

## **4 Equipment Under Test**

The tested equipment is representative for serial production.

#### 4.1 Description of EUT

The BTS performs the full RAN function of LTE system (evolved UTRA). This is sometimes referred to as collapsed RAN, where equivalent functions of former 3G BTS and 3G RNC are all integrated into BTS. BTS is connected directly to the core network via S1 interface, and to mobile stations via Air interface (Uu). In addition BTSs are optionally connected directly to each others via X2 interface for handover purposes.

### 4.2 Configuration of EUT

The used different EUT configurations are shown by the following tables.

| Module Type               | Flexi LTE BTS RF module 1.7GHz/2.1GHz |                 |  |
|---------------------------|---------------------------------------|-----------------|--|
| Frequency Bands           | Uplink                                | Downlink        |  |
| Block A:                  | 1710 – 1720 MHz                       | 2110 – 2120 MHz |  |
| Block B:                  | 1720 – 1730 MHz                       | 2120 – 2130 MHz |  |
| Block C:                  | 1730 – 1735 MHz                       | 2130 – 2135 MHz |  |
| Block D:                  | 1735 – 1740 MHz                       | 2135 – 2140 MHz |  |
| Block E:                  | 1740 – 1745 MHz                       | 2140 – 2145 MHz |  |
| Block F:                  | 1745 – 1755 MHz                       | 2145 – 2155 MHz |  |
|                           | Single                                | Carrier         |  |
| Rated Output Power (Prat) | 60 W                                  |                 |  |
| Channel Bandwidth         | 5MHz (Config. A), 10 MHz (Config. B)  |                 |  |
|                           | RX                                    | TX              |  |
| Number of Antenna Ports   | 6                                     | 6               |  |
| МІМО                      | Yes                                   | Yes             |  |

**Table 4-1: Overview of EUT Configuration** 

The tests were performed with one EUT at the antenna ports TX1 and TX2.

The used different EUT configurations are shown by the following table.

| Module Name           | Serial-No.                | Module Type | Config.         |
|-----------------------|---------------------------|-------------|-----------------|
| FRIE                  | L9094500658               | RF module   | A, B            |
| FRIE                  | L9094500657               | RF module   | A, B            |
|                       |                           |             |                 |
| Other Modules         | Module Type               |             | Config.         |
| Other Modules<br>FSME | Module Type System module |             | Config.<br>A, B |

**Table 4-2: Configuration of EUT** 

For a functional description of the modules, please refer to the appropriate related parts and exhibit sections of this certification application.

#### 4.3 Operating Conditions

If not stated otherwise, the following standard setup procedure for the EUT was used:

The transmitter was set up according to 3GPP TS 36.141 E-UTRA Test Models (E-TM) for all tests.

- E-TM 1.1: QPSK modulation,
- E-TM 3.1: 64QAM modulation.
- E-TM 3.2: 16QAM modulation

The Flexi LTE BTS was supplied with 48 V DC.

During the measurements, one carrier channel was tested at a time. The carrier was set to the maximum power level to ensure the maximum emission amplitudes during all measurements.

During the tests, the NodeB is transmitting a pseudo random bit pattern on the data channels. This ensures that the measurements of the emission characteristics of the transmitter are pursuant to § 2.1049.

### 4.4 Compliance Criteria

The EUT must fulfil the requirements (described in the specifications mentioned in chapter 2.1, Specifications) for the selected test cases.

# **5 General Description of Tests**

#### 5.1 Tested Carrier Frequencies

The measurements were on 3 carrier frequencies, according to the following table:

### Config A:

| Channel Bandwith: 5MHz |                                     |  |
|------------------------|-------------------------------------|--|
| Frequency [MHz]        | Remark                              |  |
| 2112.5                 | lowest possible carrier frequency   |  |
| 2132.5                 | frequency at the middle of the band |  |
| 2152.4                 | highest possible carrier frequency  |  |

Table 5-1: Carrier Frequencies for 5MHz channel bandwidth

### Config B:

| Channel Bandwith: 10MHz |                                     |  |
|-------------------------|-------------------------------------|--|
| Frequency [MHz]         | Remark                              |  |
| 2115.0                  | lowest possible carrier frequency   |  |
| 2132.5                  | frequency at the middle of the band |  |
| 2149.9                  | highest possible carrier frequency  |  |

Table 5-2: Carrier Frequencies for 10MHz channel bandwidth

#### 5.2 Modulation Characteristics

The EUT supports QPSK, 16QAM and 64QAM modulation.

#### 5.3 Test Configuration

If not stated otherwise, the following measurement configuration was used to perform all measurements (see figure below).

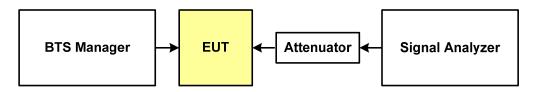

Figure 5-1: Test Configuration

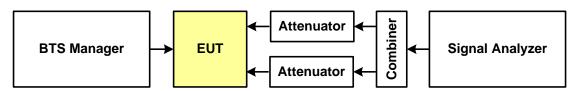

Figure 5-2: Test Configuration combined output

The RF output of the transceiver (cell) under test is connected to a signal analyzer via a high power attenuator to protect the input of the signal analyzer from high RF power levels. A

description of the analyzer settings is given in each of the sections describing the measurements. The other transceivers are terminated.

A complete list of the measurement equipment is included on page 32 of this measurement report.

### **5.4 Calibration of the Test Equipment**

All relevant test equipment has a valid calibration from an external calibration laboratory. Additionally the signal analyzer has a built-in self-calibration procedure. This calibration procedure was activated prior to the measurements so that the analyzer is deemed accurate. High quality cables were used to connect the measurement equipment to the EUT. The actual loss of the attenuator and the cables was measured with a high precision network analyzer and taken into account for all measurements.

## **6 Test Results**

#### 6.1 Test No. 1: RF power output (§ 2.1046, § 27.50)

#### 6.1.1 Purpose

The RF power output measurements were performed pursuant to § 2.1046 in order to determine the base station maximum RF output power of the EUT.

#### 6.1.2 Limits

According to § 27.50, base stations are limited to an EIRP of 1640 watts/MHz when transmitting with an emission bandwidth greater than 1 MHz

### 6.1.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

### 6.1.4 Test Configuration

The test configuration used is described in section 5.3 of this report.

#### 6.1.5 Test Procedure and Results

Detachable Antenna:

The peak power at antenna terminals is measured using an in-line peak power meter or a signal analyzer.

Using a signal analyzer the RF power is measured with a frequency sweep across the carrier (see screenshots). The carrier power is calculated from the signal analyzer by integration over the result. The base station maximum output power is the sum of the measured carrier power and the external attenuation (cable loss of the test set up).

The following table shows the measured output powers at the antenna connector. Screenshots of the measurements are included on page 33 onwords of this report.

# Config A TX1:

| Carrier Frequency  | RF Power Output  |        | Result    |
|--------------------|------------------|--------|-----------|
| [MHz]              | [dBm]            | [W]    |           |
| QPSK-Modulation    |                  |        |           |
| 2112.5             | 47.24            | 52.97  | compliant |
| 2132.5             | 47.52            | 56.49  | compliant |
| 2152.4             | 47.65            | 58.21  | compliant |
| 16QAM-Modulation   |                  |        |           |
| 2112.5             | 47.23            | 52.84  | compliant |
| 2132.5             | 47.47            | 55.85  | compliant |
| 2152.4             | 47.67            | 58.48  | compliant |
| 64QAM-Modulation   | 64QAM-Modulation |        |           |
| 2112.5             | 47.19            | 52.36  | compliant |

Table 6-6: Results – RF Power Output (10 MHz Channel BW, TX1+TX2)

The base station maximum output power was found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

### 6.2 Test No. 2: Modulation Characteristics (§ 2.1047, § 2.201)

The occupied bandwidth was measured to be 5 MHz (Config. A) respectively 10 MHz (Config. B), which represents the 99% power bandwidth (see the following section and screenshots on pages 40). Therefore, the modulation characteristic of the base stations transceiver is **5M00F9W** or **10M00F9W**.

No further testing is required under this section of the FCC rules. No measurements other than the occupied bandwidth are required.

The modulation characteristics were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

### 6.3 Test No. 3: Occupied Bandwidth (§ 2.1049)

### 6.3.1 Purpose

The measurements are performed to determine the occupied bandwidth of the EUT pursuant to § 2.1049.

#### 6.3.2 Limits

According to § 2.1049 the 99% occupied bandwidth is the width of a frequency band such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to 0.5% of the emitted power.

### 6.3.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

## 6.3.4 Test Configuration

The test configuration used is described in section 5.3 of this report.

#### 6.3.5 Test Procedure and Results

The 99% occupied bandwidth of the carrier emission is measured using a signal analyzer with Resolution Bandwidth set to 30kHz (less than 1% of bandwidth). (see screenshots on page 40 for details). The following table summarizes the results:

### Config A TX1:

| Carrier Frequency        | Occupied Bandwidth | Result    |  |  |  |
|--------------------------|--------------------|-----------|--|--|--|

Table 6-10: Results – Occupied Bandwidth (10 MHz Channel BW, TX2)

The occupied bandwidth was found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

#### 6.4 Test No. 4: Spurious Emissions at Antenna Terminals (§ 2.1051, § 2.1057, § 27.53)

#### 6.4.1 Purpose

The measurements of the spurious emissions at the equipment output terminals were performed pursuant to § 2.1051 in order to verify that all emissions are below the limits given by § 27.53.

#### **6.4.2 Limits**

Compliance with § 27.53 requires that any emission be attenuated below the transmitter power by at least 43 + 10  $\log_{10} P$  (P = transmitter power in Watts).

The compliance limit was calculated in the following way:

Maximum transmitter output power [W]: P

Maximum transmitter output power [dBm]:  $30 + 10 \log_{10} P$  (conversion from W to dBm)

Attenuation required by FCC:  $43 + 10 \log_{10} P$ 

Compliance limit = Maximum transmitter output power- Required attenuation

 $= 30 + 10 \log_{10} P - (43 + 10 \log_{10} P) = -13 dBm$ 

#### 6.4.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

#### 6.4.4 Test Configuration

The test configuration used is described in section 5.3 of this report.

#### 6.4.5 Test Procedure and Results

Signal analyzer settings:

The tests were carried out in accordance with § 27.53. For all frequency ranges except two (the one immediately below and the one immediately above the carrier frequency block) a 1 MHz resolution bandwidth was used for the measurements.

In the 1 MHz frequency bands immediately outside and adjacent to the carrier frequency block a resolution bandwidth is lowered to 1% of the 26 dB occupied bandwidth of the transmitted carrier and at minimum to 30kHz.

According to § 2.1057, all emission including the fundamental frequency of the transceiver and all frequencies up to the 10th harmonic were investigated.

The following tables summarize the worst case detected emission levels (see screenshots on pages 46 for details). The external attenuation (cable loss of the set up) is already added in the results. It can be seen separately as the 'Offset' value in the screenshots.

### Config A Lower band edge:

| Carrier Frequency: 2112.5 MHz |                          |                                 |  |

Table 6-16: Results - Spurious Emissions (10 MHz Channel BW)

The measured conducted emission levels were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

#### 6.5 Test No. 5: Field Strength of Spurious Radiation (§ 2.1053, § 2.1057, § 27.53)

### 6.5.1 Purpose

The measurement of spurious radiated emissions was performed pursuant to § 2.1053 and § 2.1057 to verify that the field strength of any spurious emissions radiated directly from the cabinet, control circuits, power leads or intermediate circuit elements are attenuated below the transmitter power P by at least 43 + 10  $\log_{10}$  (P in Watts) dB as is required by § 27.53 (Emission limits).

#### **6.5.2 Limits**

Compliance with § 27.53 requires that all spurious emissions be attenuated below the transmitter power by at least 43 + 10  $log_{10}$  P (P = rated maximum transmitter output power in Watts).

The compliance limit was calculated as per the following table:

| Rated maximum transmitter output power: | 60.0 W (= 47.8 dBm)                             |
|---|---|
| Required attenuation:                   | 43 + 10 log <sub>10</sub> 60.0 = <b>60.8 dB</b> |

According to § 2.1057, all emissions to the 10th harmonic were investigated.

#### 6.5.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

#### 6.5.4 Test Configuration

The measurements were performed in an anechoic chamber. The radiated test site complies with the site attenuation requirements listed in ANSI C63.4 1992 and is listed with the FCC.

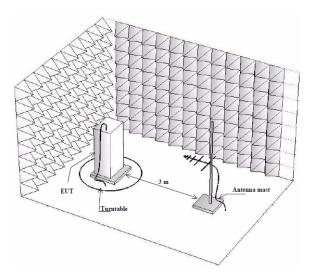

Figure 6-1: Test Configuration

Photographs of the EUT in the anechoic chamber are shown on page 101 of this measurement report.

#### 6.5.5 Test Procedure

TIA/EIA-603-C-2004, Section 2.2.12

The test was performed in a semi-anechoic shielded room. The EUT was placed on a non-conductive 0.8 m high table standing on the turntable. During the test in the frequency range 30-26500 MHz the distance from the EUT to the measuring antenna was 3 m. In order to find the maximum levels of the disturbance radiation the angle of the turntable, the height of the measuring antenna were varied during the tests. The test was performed with the measuring antenna being both in horizontal and vertical polarizations.

Vertical and horizontal polarizations in the frequency range 30 – 26500 MHz was first measured by using the peak detector. During the peak detector scan the turntable was rotated from 0° to 360° with 30° step with the antenna heights 1.0 m and 2.5 m.

The limit of -13 dBm has been calculated to correspond 84.4 dB ( $\mu$ V/m). Spurious emissions closer than 20 dB to the limit was measured with average detector.

The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The EUT was replaced with a reference substitution antenna with a known gain referenced to an isotropic radiator  $G_{Antenna[dBi]}$ . This antenna was fed with a signal at the spurious frequency  $P_{Gen[dBm]}$ . The level of the signal was adjusted to repeat the previously measured level. The resulting

EIRP is the signal level fed to the reference antenna corrected for gain referenced to an isotropic.

The formula below was used to calculate the EIRP of the EUT.

 $P_{EIRP[dbm]} = P_{Gen[dBm]} - L_{Cable[dB]} + G_{Antenna[dBi]}$ 

#### 6.5.6 Test Results & Limits

Worst case detected emission levels are reported in the following table (refer to spectral plots included on pages 101 for details). The antenna factor and cable loss is according to the manufacturer's specification.

#### Config A:

| Frequency                | Maximum Emission Level             | Result    |
|--------------------------|------------------------------------|-----------|
| [MHz]                    | [dBm]                              |           |
| All                      | More than 20dB below limit -13 dBm | compliant |
| Measurement Uncertainty: |                                    | ±5.4dB    |

Table 6-17: Results – Field Strength of Spurious Radiation (5 MHz Channel BW)

#### Config B:

| Frequency  | Maximum Emission Level             | Result    |  |
|------------|------------------------------------|-----------|--|
| [MHz]      | [dBm]                              |           |  |
| All        | More than 20dB below limit -13 dBm | compliant |  |
| Measuremen | Measurement Uncertainty:           |           |  |

Table 6-18: Results – Field Strength of Spurious Radiation (10 MHz Channel BW)

The measured emission levels were found to be compliant with the manufacturer's specifications and with all requirements of the FCC rules.

#### 6.6 Test No. 6: Frequency Stability (§ 2.1055, § 27.54)

#### 6.6.1 Purpose

Frequency stability measurements were performed to verify that the frequency deviation of the emission stays within the licensee's frequency block under extreme temperature (-30°C to +50 °C) and supply voltage conditions according to § 2.1055.

#### **6.6.2 Limits**

According to § 27.54, the frequency of the fundamental emission is required to stay within the authorized frequency block, independent of the ambient temperature and the supply voltage.

#### 6.6.3 EUT Operating Condition

The standard setup procedure as described in section 4.3 of this report was used.

#### 6.6.4 Test Configuration

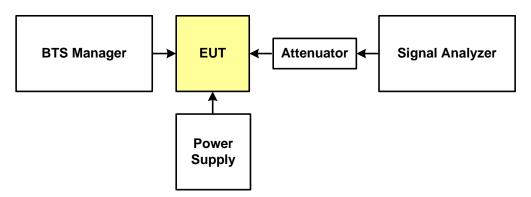

Figure 6-2: Test Configuration for frequency stability with voltage variation

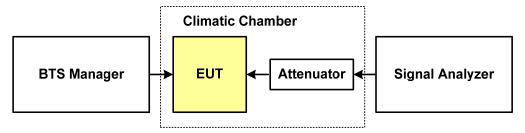

Figure 6-3: Test Configuration for frequency stability with temperature variation

A complete list of the measurement equipment is included on page 32 of this measurement report.

#### 6.6.5 Test Procedure and Results

Frequency Stability with Temperature Variation:

The input voltage to the EUT is set to the nominal value and the temperature of the environmental chamber is varied in 10 degree steps from -30 degrees celsius to +50 degrees celsius. The EUT is allowed to stabilize at each temperature and the frequency error is measured.

Table 6-22: Results – Frequency stability with temp. var. (10 MHz Channel BW, TX2)

Frequency Stability with Voltage Variation:

The EUT is placed in a climatic chamber and allowed to stabilize at +20 degrees celsius for at least 15 minutes. With the voltage input to the EUT set to 85% of the nominal value, the frequency error is measure. This procedure is repeated at 100% and 115% of the nominal value.

Table 7-1: Part List of the RF Measurement Test Equipment

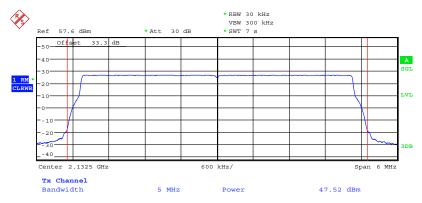

#### 7.2 Spectral Plots

## 7.2.1 Test No. 1: RF Power Output

The value 'Power' is the carrier power (RF Power Output) measured by the signal analyzer. 'Offset' is the external attenuation (cable loss of the test set up). The external attenuation is frequency dependant. Thus the various 'Offset' values in the screenshots may differ.
